

A Small Guide to Curiosity

Five simple ways to notice more, learn faster, and make ordinary days more interesting.

1. Ask one more question

When something seems obvious, ask one additional question: Why does it work that way? What would change the outcome? Who sees it differently? A single extra question often turns passive information into active learning.

2. Keep a tiny observation log

Write down one thing each day that surprised you. It can be a pattern in traffic, a phrase someone used, an unexpected result, or a small design detail. Over time, these notes become a map of what naturally catches your attention.

3. Change the scale

Look at the same subject from very close up and very far away. For a city, that might mean studying one street corner and then the whole transport network. Changing scale reveals relationships that are easy to miss.

4. Follow useful friction

Confusion is often a clue. When an explanation feels incomplete or two facts seem to conflict, resist the urge to skip ahead. That friction may point to the most interesting part of the topic.

5. Make something from what you learn

Summarize an idea, sketch a diagram, explain it to a friend, or build a tiny experiment. Creating an output forces you to identify what you understand and what still needs work.

Try today	Time
Notice one detail you normally ignore.	2 min
Ask a follow-up question about something familiar.	5 min
Explain one new idea in three sentences.	5 min

Curiosity does not require a special destination. It starts by paying closer attention to where you already are.
